Project

1. Take an experimental paradigm (classic or not), program it (variations are welcome!).
2. Write good documentation (website in form of github pages) so that other people can use your code.
3. (optional) If possible:
    - run it on a few pilot subjects,
    - perform succinct data exploration (descriptive stats and graphics)
    - include a short report on the webpage of the project.

See example at https://chrplr.github.io/PCBS-LexicalDecision/

---

https://chrplr.github.io/PCBS-LexicalDecision/

```
git clone https://github.com/chrplr/PCBS-LexicalDecision.git
cd PCBS-LexicalDecision
cat README.md
```

=> you will need to learn **Markdown**.

- short: https://github.com/adam-p/markdown-here/wiki/Markdown-Cheatsheet
- long: https://www.markdownguide.org/

Using Git

Locally:

```
git init

git status
git add <files>
git commit

git status
git add <files>
git commit

git log
git checkout <commit_id>
```

Link to another repository, e.g. on github

```
git remote add <name> <URL>
git push
git pull
```

Let's try it...
